

DNS records to add for email (Resend)

We're turning on transactional email (welcome & password-reset messages) for the app, sent through **Resend**. That needs a few DNS records on a new subdomain, `send.persephonesbasket.com`, added in **Wix** (where the domain's DNS lives). These records only affect the `send` subdomain and **do not change the existing Google Workspace email** on the main domain.

Please don't modify the existing records. Leave the current **MX** (Google, `aspmx.l.google.com`) and the current root **SPF TXT** (`v=spf1 include:_spf.google.com ~all`) exactly as they are — everything below is *new* and lives on the `send` subdomain.

Step 1 · Get the exact values from Resend

- 1 In Resend (`resend.com`) go to **Domains → Add Domain**, enter `send.persephonesbasket.com`, and choose a region. Resend then displays the exact DNS records below. **Copy the real values from that screen into the table** — the DKIM value and the MX region are unique to this account, so use Resend's, not the placeholders.

Step 2 · The records to add

Type	Host / Name	Value	Priority
MX	send	feedback-smtp. <i>[region]</i> .amazonses.com	10
TXT (SPF)	send	v=spf1 include:amazonses.com ~all	—
TXT (DKIM)	resend._domainkey.send	p= <i>[long key – copy from Resend]</i>	—
TXT (DMARC) optional	_dmarc.send	v=DMARC1; p=none;	—

Host names are written relative to the domain — Wix adds `.persephonesbasket.com` automatically, so enter just `send`, `resend._domainkey.send`, and `_dmarc.send`.

Step 3 · Add them in Wix

1. Wix dashboard → your site → **Settings**.
2. Open **Domains**, click **persephonesbasket.com**, then **Edit DNS / Manage DNS Records** (under Advanced).
3. For each row above, click **+ Add Record**, pick the **Type** (MX or TXT), enter the **Host Name** exactly as shown, and paste the **Value**.
4. For the **MX** record, set **Priority** to `10`. Leave **TTL** at the default for all records.
5. Click **Save**.

When the records are saved, just let us know. We'll click *Verify* in Resend — Wix usually propagates within a few minutes (occasionally up to 48 hours), and the domain flips to *Verified*. Nothing else is needed on the Wix side after that.
